

New Features & Enhancements for FCS

a Jobba Trade Technologies product

FCS is a fully integrated, cloud-based software system that reaches every aspect of a commercial roofing business. This document outlines the new features and latest enhancements made to FCS.

Sales Module

- Users now have the option to add the Group logo to the OPM Progress Report.
- All product jobs can be bid out to multiple GCs when creating an Opportunity. Previously, the Bid to Multiple Contractors feature was only available for production jobs.

Service Module

- In the user admin settings, users can disable the invoice link on mobile. This will remove mobile users' access to your customer's sensitive financial data.
- The Tech Notes data field in the mobile work has been enlarged to allow for a full view of all notes that the tech sends and receives.
- Company/property relationships have been optimized to prevent users from being exited from FCS when accepting and creating a PRIN work order.
- When scheduling a dispatch, the hour and minute input style has been changed from a free-text field to dropdowns.
- The ability to upload more than one picture at a time is now available for the Inspection Mobile workflow and the Client View mode. *Plans are in place to expand this enhancement to other parts of the application in a future release.*
